Neotropical Savannas and Seasonally Dry Forests: Plant Diversity, Biogeography, and Conservation (Systematics Association Special Volumes)

Are these ecosystems adequately protected and, if not, which areas should be elevated into priorities for conservation, and how can this be best achieved?

This work is the first extensive compilation of the patterns of plant biodiversity in these neotropical ecosystems. The overview also provides a summary of what is known of their evolutionary history, including an examination of the links to the development of analogous vegetation in Africa. In contrast to previously published titles that emphasize ecology and physiology, this work focuses on plant biodiversity and reviews molecular phylogenetic and molecular population genetic approaches to discovering biogeographic history.
